

5 reasons for the nevisCura bed sensor

The bed sensor from nevisCura is an intelligent bed exit alarm that makes everyday work easier for caregivers. Once attached to the bed, the silent sentinel discreetly reports when a resident wants to leave the bed - even before he or she has set foot on the floor.

Easy to use

The bed sensor puts an end to time-consuming moving of the sensor mat back and forth and unnecessary walking due to false alarms. This is not only easy on the back, but also saves time.

Low cleaning effort

The high-quality and insensitive plastic is easy to clean and can be simply washed off with a wipe without having to dismantle the bed sensor.

Less falls

nevisCura detects much earlier than a sensor mat that a person wants to leave the bed. This means that caregivers can already help the resident to get up, thus reducing the risk of falls to a minimum.

HIGH INVESTMENT PROTECTION

The bed sensor is durable and future-proof. The hardware is dimensioned in such a way that it can be used and updated for years. Various interfaces enable the connection to care software.

Maximum discretion

The device is almost invisible to the occupant. This is not only really chic, but also makes sense. Because residents are not tempted to go to great lengths to bypass the system, as is often the case with a sensor mat.
