

nevisCura Bed Sensor at Alloheim Senioren-Residenz Godenblick

Facility:

- 108 beds
- Alarm connection to Ackermann nurse call system

Result:

- Fewer falls
- Faster reaction after getting out of bed

Why should the bed sensor be used?

We want to use the nevisCura bed sensor primarily for residents who are very restless. We want to know promptly when these residents get up so that we can react quickly and prevent falls, for example.

How does the bed sensor support everyday work?

The nevisCura bed sensor triggers as soon as the resident sits down on the edge of the bed. This is an advantage compared to other systems, e.g. mats under the mattress, which only trigger when the resident has left the bed. The bed sensor is particularly helpful at night to react quickly and prevent falls.

Advantages

- Early alarm when sitting on the edge of the bed, not just when getting out of bed
- Quick reaction possible
- Prevents falls, especially at night
