

nevisCura Bed Sensor at Charleston Wohn- und Pflegezentrum Friesenhof

Facility:

- 62 beds
- Alert connection to DeTeWe

Result:

- Risk of falling is significantly minimized
- user-friendly
- does not interfere with work processes at the bedside

Why should the bed sensor be used?

As we do not want to use bed restraints, the sensors are a good measure to counteract falls.

The bed sensor is primarily intended for use with residents who have dementia and are nocturnal.

How does the bed sensor support everyday work?

The sensors provide safety for residents and staff. By preventing injuries caused by falls, further consequential damage can be avoided.

From a financial perspective, recourse claims from health insurance companies and the time required to process correspondence are significantly reduced.

Advantages

- User-friendly and non-intrusive
- No bed fixations thanks to the bed sensor
- Sense of safety for residents and staff
- Reduction of injuries and consequential damage
