

nevisCura Bed Sensor at Haus Kappen

Facility:

- 57 beds
- Alarm connection to Honeywell nurse call system

Result:

- Residents with dementia do not recognize the sensor and show no fears
- Fast response to alarm triggering

Why should the bed sensor be used?

Bed sensors were to be used as an alternative to the sensor mat. These were seen as a disturbing factor by many residents; residents with dementia were afraid to step on the mat or walked around it. Oriented residents pushed them away.

How does the bed sensor support everyday work?

Resident acceptance of the nevisCura bed sensor is better than with the sensor mat. In addition, care staff now notice more quickly when certain residents want to get out of bed.

Advantages

- > Accepted by most residents
- > nevisCura bed sensor can be reprocessed hygienically
- > Faster detection of bed exits
