

nevisCura Bed Sensor at Specht Seniorenresidenz Steimker Gärten

Facility:

- 86 beds
- Alarm connection to Hospicall nurse call system

Result:

- Faster response from nursing staff
- Easy to use

Why should the bed sensor be used?

The decision to introduce bed sensors was prompted by an increase in the number of falls and residents with cognitive impairments who tend to wander.

How does the bed sensor support everyday work?

The bed sensors enable early detection of attempts to get out of bed, particularly among residents at risk of falling. This allows my staff to respond promptly and offer assistance. The bed sensors are used for residents with an increased risk of falling, particularly those with dementia, disorientation, limited mobility, or nighttime restlessness.

Advantages

- > Caregivers can respond more quickly to movement
- > It is easy to use
