

nevisCura Bed Sensor at Alloheim Senioren-Residenz Elsdorf

Facility:

- 80 beds
- Alarm connection to Hospicall nurse call system

Result:

- Approx. 80% fewer falls out of bed
- Fewer trips back and forth
- Cost savings due to fewer defects

Why should the bed sensor be used?

The bed sensor is designed to detect early on when a resident sits up on the edge of the bed on their own. The goal is to reduce the number of falls among residents at risk of falling. Previously, bell mats were used, but they were repeatedly pushed under the bed or broke.

How does the bed sensor support everyday work?

The bed sensor is particularly helpful for residents with dementia who have a strong urge to move around and for residents who overestimate their own strength. The residents are unaware of the sensor system.

Advantages

- > Fewer walking paths
- > Easy to disinfect
- > Durable
